

# Automatic Dry Lathe Machine Line

Break-through Technology  
for complete wheel dry machining including drilling

## Features:

- Complete wheel machining requires only 1 vertical lathe and 1 drilling machine for fully automatic process
- Flexible automation for loading and unloading, no-man operating, time and manpower saving
- Each machine has 2 spindle, 2 working stations in parallel operation, tool change time and idle time saving with no time lost
- Used special minor dosing lubricant (dry) for machining, without water coolants and save water coolant costs and at the same time better for the environment as well as working condition for operators.
- One process line of machining for completion, increase productivity
- Machining measuring system ensuring machining precision
- Completed safety guard for production

Machine line is today leading on metal industry with special clamping system and cutting tools with minor dosing coolants (dry). According to statistic figure, water coolants covered 16% of the machining costs in total. Our advantage is while saving these manufacturing costs also increases the productivity. Share our know-how and experiences, we will provide you the best solution for your requirements.
